Project On

FIFA Player Management System

FIFA(International Federation of Association Football)

18BCI0203 - Md Arham Siddiqui
18BCE0682 - Anuj Kapoor

Review 3

Abstract*:*

'FIFA 18 Player management system' is player management software for monitoring and accessing players based on their FIFA 18 PC or XBOX Game ratings. The project will be developed using HTML, CSS and JavaScript for front-end and PHP, MySQL for back-end, which focuses on basic operation like adding a new player, new statistics, searching players with detailed information and edit as they grow their skills. This project is a web based application designed and developed to help user's access players and organise teams.
This project also aims at providing best user interface along with searching, insertion, and deletion with procedure capabilities for each player in FIFA.

Hardware and software requirements :

- Windows 7 or higher version OS
- WAMPP web server
- Google chrome v70.0.3538 or greater
- 1.7 or more GHz processor
- 32/64-bit processor
- i3 or greater intel processor chip

Introduction:

The project will have player details, which will describe about player biodata such as age and nationality. It will also consist of player stats which describes about players technical skills. It will also consist of tables containing details such as player earnings, club information and preferred position of playing. It will also provide a strong searching, updating, deleting and inserting operations with a user friendly web based UI. The project will help the users to keep track of the player details in a computerised way without any trouble. The project will contain 7 stored procedures and 3 triggers per table. Stored procedures are used in search engine. Every time the user searches through the database, a procedure is called and the

results is collected and displayed for the user in a structured manner. It also has 3 trigger namely "Insert, Delete and Update" triggers assigned separately to each table. Whenever operations such as insert or delete or update will be performed on any table, these triggers will be automatically called, and the logs will be captured into 3 separate tables, individually for each trigger. Hence use of triggers will provide users to trace back all the latest as well as the oldest changes into any table at any point of time.

Website Structure

Home page

⬤ **Menus**

- Home
- Search
- Update*
- Insert*
- Database
- Report
- Procedures*
- About

*Further in each menu option there will sub menus or operations

At Center

Category based Search option
Categories: (of players)

- Age
- Nationality
- Overall rating
- Player ID
- Player Name

- Player Position
  - Team
